PROGRAMME OF THE INTERNATIONAL FINANCIAL CONGRESS

28 JUNE - 02 JULY

The program is published as of June 18, 2021

11:00 - 11:50

Track: Macroprudential policy

Macroprudential policy of the Bank of Russia: new challenges and tools

The pandemic crisis has shown the importance of banks accumulating capital and liquidity buffers. Built up during prosperous times, these buffers allowed the banks to absorb losses incurred throughout the pandemic.

Against the backdrop of economic recovery and accelerated lending, the Bank of Russia has already returned to its pre-pandemic buffers for new unsecured loans.

In the future, the Bank of Russia plans to use a new tool – quantitative limits, which could become an effective risk mitigation solution. Session participants will discuss a range of related questions: How will the new tool complement the existing risk mitigation mechanism?

What will macroprudential policy look like as the economy recovers? How will it affect the banking business?

Moderator

Elizaveta Danilova

Director of the Financial Stability Department,
Bank of Russia

Speakers

Stanislav Bliznuk

Chairman of the Board of Directors, Tinkoff Bank

John Fell

Deputy Director General for Macroprudential Policy
and Financial Stability, ECB

Track: Microfinance

Strategic risks and new opportunities for the banking sector

The session will feature a discussion with banks' representatives and focus on major risks for the sector and development prospects of the banking business.

In particular, the following issues will be covered:

1. Strategic risk of disintermediation, including the impact of the population's dynamic shift to direct investment in the stock market, potential effects of digitalization and the introduction of the digital ruble.
2. Classic risks of the banking sector, including risks related to concentration, overheating of certain segments, and decrease in the bank margins.
3. New challenges: climate, social and corporate governance risks.

Ecosystemically important. Regulating banks' investments in 'non-bank' assets'

Some ecosystems in Russia are emerging around major banks, which presents them with new opportunities, but also means potential risks for borrowers and depositors, as well as for financial stability.

This session will discuss the Bank of Russia's suggestions with regard to modernizing the regulation of banks' investments into ecosystems and other non-banking assets. How will it help balance the banks' needs with the interests of their clients, while supporting the development of the Russian financial market?

Moderator

Sergey Shvetsov

Track: Banking Sector

The role of the banking sector in housing market development: project financing and mortgage. Stable growth or risk of a bubble?

Session participants will discuss how the structure of shared-equity construction financing and the mortgage market have changed over the two years since the reform started.

The discussion will also explore how the distribution of risks should change and whether there is a threat of an emerging bubble.

Some of the burning issues on the agenda will include growth prospects of mortgage, impact of state support programmes, including their impact on housing accessibility, ensuring demand and maintaining financial stability.

Moderator

Bank regulation: looking ahead

The most pressing issues on the national level are the ecosystemic transformation of the banking sector, growing competition with the fintech industry, and risks of high concentration in the banks' portfolios.

The new technological basis of bank regulation will be shaped by the use of IT for ensuring banks' compliance with regulations (RegTech) and for automating bank supervision (SupTech).

This session will touch upon major problems and prospects of bank regulation, and the participants will try to make projections with regard to its evolution over the next few years.

Product Governance: reducing risks for consumers through higher transparency and effectiveness of financial products

Bank of Russia is looking into the possibility of introducing product governance, following the example of many foreign regulators.

This approach reduces risks for consumers upon introduction of new products or services. In this case, regulation covers the whole product cycle from its development and testing to its sale and subsequent customer service.

Session participants will discuss the following issues: Would it be reasonable to apply this approach in Russia? Will it help mitigate the risks that are most relevant for the Russian consumers? Would it be possible for the regulator, financial organisations and their self-regulatory organisations to collaborate on product governance?

Moderator

Mikhail Mamuta

Member of the Board, Director of the Service for Consumer Protection and Financial Inclusion, Bank of Russia

Speakers

Maria Lúcia Leitão

Head of Banking Conduct Supervision Department, Bank of Portugal

Climate risks in insurance

Today the climate agenda increasingly dominates any discussion on development. Insurance is likely one of the financial market sectors most affected by this issue. However, how can we take into account climate risks in practice? What data and models accounting for climate risks do we need and where can we find them? What data on climate risk exposure should the insurers' and non-finance actors' reporting include? What climate change scenarios exist, who forecasts them, for which horizon and how should they be factored in prudential regulation? And the most important question: what can the insurance sector do to reduce climate risks and prevent the negative scenario from happening?

Moderator

Pavel Samiyev

General Director, BusinessDrom Analytical Agency

Speakers

Korney Bizhdov

President, National Association of Agriculture Insurers

Competition, technology, and data: synergy and new opportunities

Digitalisation contributes to fierce competition for market share and consumer engagement. Many markets are increasingly dominated by cross-industry ecosystems that accumulate network effects and large volumes of user data. Under these circumstances, it is becoming especially important to protect competition and ensure equal access to financial services. Besides, the financial market's development and competition protection are influenced by the rules of data exchange. Before the advent of the digital era, financial data would rarely leave banks and processing companies, whereas Open APIs have enabled consumers to transfer their data to third-party service providers. However, Open API standards may not be enough for data suppliers and consumers to cooperate successfully: common rules and incentives for working in the Open API environment might be required as well. The stakeholders need to work in several areas: expand the infrastructure, develop the APIs, and establish rules and conditions for data exchange.

The following issues are on the session's agenda:

1. Promoting competition and developing infrastructure.
2. APIs: compulsory or voluntary use?
3. Experience in implementing PSD2.
4. Operators and platforms: the market's vision vs the regulator's vision.

Ecosystem transformation: regulatory approaches

Digitalization is changing our life rapidly: digital platforms and ecosystems are shaping a new standard of quality for search, sales, and services. The line between digital and physical is blurred, and when ordering something online, we expect the order to be at our doorstep in an hour. Such a merger of the two worlds opens up new development opportunities for merchants, including SMEs, and removes geographic barriers.

Russia is one of the few countries in the world where domestic rather than international ecosystems occupy a leading position in the market, and perhaps the only one where the ecosystems were largely shaped by the financial sector.

During the discussion, we will debate whether it is necessary to change regulations for the "platform economy", look for a balance between protecting the weaker players and letting the stronger ones develop, as well as between momentary convenience and long-term risks, and we will discuss which regulatory measures are most consistent with the classic principle of "First, do no harm".

Global transition to green economy: challenges for Russia and the financial sector's role

Recently, many governments of leading economies and private sector actors have been setting increasingly ambitious climate targets, in particular in terms of reducing emissions and use of coal as well as other carbon-heavy commodities. In the medium term, one could expect not only cross-border taxation, but also significant strategic shifts and changes in consumers' preferences. Given the role of carbon-heavy commodities in the Russian economy, a global shift to green economy could have major repercussions for the country, which need to be taken into account by the financial and real sector alike.

What should the Government, Bank of Russia and private actors do to contain the increasing risks? How can Russia turn climate challenges into strategic opportunities?

From Bitcoin to stablecoins and CBDCs: how digital technology is transforming the global monetary system

Digital technologies have had a dramatic impact on the global monetary system. Physical distances now matter less than a working internet connection, and payments are increasingly fast and secure – which is good for the consumers. But the first ten years of cryptocurrencies' circulation have shown substantial risks for consumers and the system at large, ranging from technological risks to the threat of payment systems being used for terrorism financing and money laundering, as well as the risk of undermining the effectiveness of some countries' monetary policies.

Recently, many central banks have started to consider issuance of their own digital currencies (so called CBDCs), which would be widely accessible to the public. Central banks are also discussing the connectivity of CBDCs, which is necessary for them to compete with global stablecoins.

This session will focus on these and other implications that the development of official and private digital payment instruments may have for the global monetary system. We will also discuss policies that would allow us to maximize the benefits of digital payment technologies while minimizing their risks.

Global and local anti-crisis policies during the pandemic (focusing on Russia's example)

In 2020, the coronavirus pandemic had a significant impact on the economies and healthcare systems of various countries. In response, central banks and governments in both developed and developing countries have adopted non-traditional instruments in addition to conventional measures. Monetary easing, asset purchases by central banks to ensure financial stability, relaxed regulations and other steps by central banks and governments helped reduce the pandemic's impact on the households and the economies at large. At this session, we will try to determine the most and least effective policies. Which of them only worked as one-offs for an extraordinary situation, and which could be added to the standard anti-crisis toolkit? What lessons should we learn, and what issues should we address following the crisis?

Evolution of the platform services: the first results

Over the last two years, an environment enabling new financial market infrastructures, i.e. platform services, has emerged, and the platform service operators are now supervised by the Bank of Russia. Since the new financial market operations' are based on the same principles, it may be practical to establish a common regulatory framework as well.

Is there a need for such unification today? Which areas of regulation could be unified without disturbing the balance of businesses' and investors' interests? The roundtable will be dedicated to discussing these issues as well as the matters of managing the risks that are typical for platform service operators, assessing various areas in terms of optimising regulatory burden for players combining several types of financial market activities, and identifying the priorities for unifying the sector-specific regulation.

Limits of regulating information services in the financial market

The current legislation obliges many financial market participants to use third parties' data (mostly pricing data and its derivatives, such as discounts, rates and indices). The existing fragmentation of markets and financial information sources leads to an increasing arbitrage between financial indicators that share the same economic logic but use different data sources, while the regulators would like to ensure the quality of this data and protect it from contributors' manipulations.

In view of this, our roundtable will be devoted to the role of information services in the financial market, determining the mechanism for assessing the quality of their information, and the need for regulators' supervision of the respective processes.

Besides, other important items on the agenda are the evolution of Russian financial information providers as well as the necessity to establish an umbrella system of financial information aggregators and to calculate consolidated intermarket indicators.

"Around 4%": inflation targeting in Russia

The Bank of Russia first announced its plans to switch to a monetary policy based on inflation targeting in its Monetary Policy Guidelines for 2012. However, in 2014-2015 the Bank of Russia had to adjust to the rapid developments quickly. 2017 marked the first time that the annual inflation approached the Bank of Russia's target of "around 4%". Over the last four years, the figures have been between 2.2% and 5.8%, and the average growth rate of consumer prices for that period has been at 3.8%. What major conclusions regarding the results of inflation targeting in Russia can be drawn at the moment?

How did households, businesses and the financial sector benefit from this increased price stability? What role did it play in 2020 in terms of mitigating the pandemic's impact on the economy?

The potential for the use of credit ratings for regulatory purposes – and beyond

The growing use of credit ratings in regulation could be beneficial both for credit rating agencies and users of ratings. But it comes at a price: the quality of credit rating and methodologies requires stronger supervision, and legal responsibility of credit rating agencies not just to issuers, but to investors as well, is becoming an important topic, too. Session participants will discuss whether there is potential for expanding the operations of Russian credit rating agencies in the absence of new regulatory requirements on obligatory use of credit ratings.

Monetary policy strategy refinement in AEs: implications for EMEs

In August 2020, the Federal Reserve's Federal Open Market Committee (FOMC) announced that it was modifying its monetary policy strategy. The FOMC plans to pay more attention to sustaining the employment at the highest level possible and to interpret its price stability goals in terms of average inflation. Meanwhile, ESG factors are going to play an increasingly important role in the ECB's monetary policy considerations. How have these changes in the monetary policy goals and strategies of advanced economies influenced the global economy and EMEs? How will they affect the length and range of business cycles as well as financial stability? Should these developments push other central banks to adjust their monetary policies as well?

Inequality in the world and in Russia: trends, driving forces, and implications for the monetary policy

To a large extent, inequality determines the economic and educational opportunities as well as social mobility of various groups and individuals, thus influencing both economic development and potential growth. Moreover, unequal distribution of incomes and savings affects the cycles of economic activity and aggregate demand, along with the long-term effects of these cycles for the most vulnerable social groups.

What are the channels of this influence? Is it important for the monetary policy's transmission mechanism? Can monetary policy curb growing inequality?

Risk management systems today: data, AI, and cloud technology

This session will discuss the role of digital technology in transforming financial risk management from several disjointed processes into an integrated, centralised process. How have ML- and AI-based models influenced the analytics predicting the effects of risks on financial institutions' and holdings' capitals, and what is the role of the model risks identified through validation and verification of such models? Have new Big Data-related technologies affected the risk management processes? Is there a wider use of data sources previously ignored by risk management? And have any comprehensive risk management tech platforms emerged lately?

Moderator

Alexander Dymov

Lifting the “corporate veil” and redrawing the limits of responsibility: who is the real winner?

Starting from July 2021, banks, insurance undertakings and pension funds will have to submit information on their controlling parties to the Bank of Russia – thus lifting the “corporate veil”. This would allow the regulator to identify financial institutions’ ultimate beneficiaries easier and faster and to hold them accountable for the institutions’ actions, if necessary.

The participants will discuss a range of related issues. Will the reform increase the effectiveness of holding accountable those responsible for financial institutions’ bankruptcies? Will financial institutions benefit from fully disclosing information about their controlling parties, or will they face an increased administrative burden? What agency will be authorised by financial institutions to verify whether the disclosed information on the controlling parties is accurate and complete?

Impact of information security risks on financial institutions’ resilience

The participants will discuss a variety of topics. What are the regulatory approaches to maintaining cyber-resilience? How are they connected to managing operational risks? What can we learn from a major Russian bank’s experience in ensuring operational resilience? What are the current challenges to operational resilience?

Given the upward trend in scope and number of information security incidents, how can regulators and financial market participants help insure financial service consumers and credit institutions against cyber-risks, and enable risk profiling of financial institutions?

Why are cyber-drills a crucial tool of stress testing? How do cyber-test sites for information security specialists work, and what could be the outsourcing models for banks with a basic license?

IPO in Russia: from hopes to reality

Enthusiasts expect an IPO boom in the Russian market and expect Russian investors to meet the growing businesses' demand for capital, while skeptics continue talking about the investment climate problems, lack of a long-term investor and sufficient number of medium-size companies that need equity capital and can attract investors.

Will IPO remain a tool for raising capital for the company's development needs, or will it finally become only the exit instrument for pre-IPO investors?

Is there a perspective for IPO/SPO to be effective tool to attract money to the Russian economy? What should be preconditions for that? Are there any specific restrictions or barriers to this, in addition to sanctions?

What are the motives for the Russian businesses to make IPO/SPO using foreign holdings? What should be the efficacious incentives for equity placement under the Russian jurisdiction? And finally, double listing:

Moscow/London and Moscow/New York: is it a fashion, a habit or real necessity?

New opportunities for market participants and regulators: RegTech, SupTech

Regulatory technology (RegTech) and supervision technology (SupTech) markets are growing rapidly, as investments in the area are increasing, and the variety of market solutions available on the market is expanding. The participants will discuss the regulators' role in developing SupTech as well as the existing barriers to implementing SupTech solutions. What is the best choice for regulators and markets: procuring solutions from vendors or developing them in-house? What will SupTech and RegTech solutions look like in the future?

Green finance for green growth

The signees of the Paris Agreement are expected to proactively redistribute their financial flows in order to fund projects aimed at developing the green economy and preventing climate change. In late 2020, the total aggregated volume of green funding worldwide exceeded USD 1 trillion, and the next milestone would be USD 1 trillion a year.

However, the European carbon regulation is going to cost Russian exporters over USD 30 billion through 2030, unless Russian manufacturers reduce the carbon footprint of their products. How will the financial market address these challenges and use the emerging opportunities? And what can today's financial experts do for the next generations?
